A molecular formula is a representation of a molecule that uses chemical symbols to indicate the types of atoms followed by subscripts to show the number of atoms of each type in the molecule. (A subscript is used only when more than one atom of a given type is present.) Molecular formulas are also used as

The two test reactions shown above are inherently very slow, but their rates are increased by special enzymes embedded in the test strip pad. This is an example of catalysis, a topic discussed later in this chapter. A typical glucose test strip for use with urine requires approximately 30 seconds for completion of the color-forming reactions.

Example 13. Show that the reaction, $\text{Fe}_2\text{O}_3(\text{s}) + 3\text{SO}_3(\text{g}) \rightarrow \text{Fe}_2(\text{SO}_4)_3(\text{s})$, can be written as a combination of formation reactions. Solution. There will be three formation reactions. The one for the products will be written as a formation reaction, while the ones for the reactants will be written in reverse.
