The relevance of commutator methods in spectral and scattering theory has been known for a long time, and numerous interesting results have been obtained by such methods. The reader may find a descr

The conjugate operator method is a powerful recently developed technique for studying spectral properties of self-adjoint operators. One of the purposes of this volume is to present a refinement of the original method due to Mourre leading to essentially optimal results in situations as varied as ordinary differential operators, pseudo-differential operators and N-body Schrödinger hamiltonians.

We present a new criterion, based on commutator methods, for the strong mixing property of unitary representations of topological groups equipped with a proper length function. Our result generalises and unifies recent results on the strong mixing property of discrete flows  $\{U^n\}_{n \in \mathbb{Z}}$  and continuous flows  $\{e^{-itH}\}_{t \in \mathbb{R}}$  induced by unitary operators  $U$  and self-adjoint operators  $H$  in a ...
