Domain- Long Division Check Domain & Range $y = 20833/10000(x^4 - 15x^3 + 78x^2 - 164x + 120)$ Since the x-axis is based off of time, the realistic domain for this ride would be in between 0 and 6 (minutes). The ride is 6 minutes long. x minimum (2,0) This is realistic for a roller

Roller Coaster Project From Stewart's Calculus – GeoGebra ...

Students apply high school differential calculus and physics to design 2D roller coasters in which the friction force is taken into consideration. Student teams first mathematically design the coaster path (using what they learned in the associated lesson) and then use foam pipe wrap insulation material and marbles to build and test small-size prototype models that match their design dimensions.

Applied Project: Building a Better Roller Coaster

In real life, polynomial functions are used to design roller coaster rides. In this project, you will apply skills acquired in Unit 2 to analyze roller coaster polynomial functions and to design your own roller coaster ride. Project Components: Application Problems - You will have to answer questions and solve problems involving polynomial ...

Calculus and physics are directly related to roller coaster design. There are two types of energy used in roller coasters: potential energy, and kinetic energy. The potential energy is the amount of energy available for the coaster to have. It is calculated by the equation $PE=mgh$ where m=mass, g=gravity, and h=height.
