Efficiency of the Reverse Carnot Cycle. An air conditioning device is working on a reverse Carnot cycle between the inside of a room at temperature T 2 and the outside at temperature T 1 > T 2 with a monatomic ideal gas as the working medium. The air conditioner consumes the electrical power P. Heat leaks into the house according to the law $\dot{Q} = \alpha(T_1 - T_2)$.

Reverse Carnot Cycle Efficiency | Matt Evans

Carnot Engine. Sadi Carnot in 1840 described an ideal engine using only isothermal and adiabatic processes.The carnot engine is free from friction and heat loses. Sadi showed that a heat engine operating in an ideal reversible cycle between two heat reservoirs at different temperatures would be the most efficient. Construction of carnot engine:

In this lesson, Harshit Agarwal solves problems pertaining to Brayton Cycle. This lesson will help you gain more proficiency on the theoretical concepts which were discussed earlier on Brayton Cycle. He explains each single step while solving the problem and elaborates each concept associated with it.

Carnot Cycle - an overview | ScienceDirect Topics

Overview The Carnot Cycle is an entirely theoretical thermodynamic cycle utilising reversible processes. The thermal efficiency of the cycle (and in general of any reversible cycle) represents the highest possible thermal efficiency (this statement is also known as Carnot's theorem - for a more detailed discussion see also Second Law of Thermodynamics).

3. 3 The Carnot Cycle. A Carnot cycle is shown in Figure 3.4.It has four processes. There are two adiabatic reversible legs and two isothermal reversible legs. We can construct a Carnot cycle with many different systems, but the concepts can be shown using a familiar working fluid, the ideal gas.

Carnot engine and carnot cycle with examples and problems

The Carnot Cycle. The Carnot cycle consists of the following four processes: A reversible isothermal gas expansion process. In this process, the ideal gas in the system absorbs q in amount heat from a heat source at a high temperature T h, expands and does work on surroundings. : A reversible adiabatic gas expansion process.
