In contrast, Fourier Modal Method and Its Applications in Computational Nanophotonics is a complete guide to the principles and detailed mathematics of the up-to-date Fourier modal method of optical analysis. It takes readers through the implementation of MATLAB® codes for practical modeling of well-known and promising nanophotonic structures.

### Fourier Modal Method and Its Applications in Computational ...

The Fourier Modal Method (FMM) is perhaps the most popular numerical technique for rigorous analysis of diffraction gratings and other diffractive structures. The method has its roots in late 1960's, in the work of Burckhardt on sinusoidally modulated volume gratings [1], and it is similar in nature as the so-called Rigorous Coupled-Wave Approach [2].

### Fourier Modal Method and Its Applications in Computational ...

The modal method is one of the most effective methods for modeling diffraction of electromagnetic waves by periodic gratings. Its basic idea is quite simple: The electromagnetic fields are first solved as eigenfunctions of Maxwell's equations in the interior of the grating region where the periodic permittivity variation occurs.

Kim, Park, and Lee establish this framework in Chapter 1 of Fourier Modal Method and Its Applications in Computational Nanophotonics. The remainder of this book is divided into six chapters. Chapter 2 begins with the concepts of scattering matrix and Bloch eigenmodes for a single block—a one-dimensional slab of finite thickness.

Abstract In this paper, a simple Fourier spectral-based method is proposed to calculate the modal curvature (MC) of beams instead of the traditional central difference method. Based on the present method, damages in beam-like structures are localized. The present method provides an alternative selection to estimate MC in damage detection.

### Fourier Modal Method and Its Applications in Computational ...

In mathematics, the term Fourier analysis often refers to the study of both operations. The decomposition process itself is called a Fourier transformation. Its output, the Fourier transform, is often given a more specific name, which depends on the domain and other properties of the function being transformed.

### Fourier spectral-based modal curvature analysis and its ...

The Fourier modal method is the most popular method for modeling diffraction gratings. The method is characterized by expanding the electromagnetic fields into Floquet-Fourier series

The Fourier modal method (FMM), often also referred to as rigorous coupled-wave analysis (RCWA), is known to suffer from numerical instabilities when applied to low-loss metallic gratings under TM incidence.
