Some important examples of image and video processing include the removal of degradations images suffer during acquisition (e.g., removing blur from a picture of a fast moving car), and the compression and transmission of images and videos (if you watch videos online, or share photos via a social media website, you use this everyday!), for economical storage and efficient transmission.

- A digital image is an image $f(x,y)$ that has been discretized both in spatial coordinates and brightness.
- The elements of such a digital array are called image elements or pixels. A simple image model:
- To be suitable for computer processing, an image. $f(x,y)$ must be digitalized both spatially and in amplitude.
