Hidden Markov models (HMMs) have been demonstrated empirically to be capable of modeling the structure of the generative processes underlying a wide variety of real-world time series. However ...

Hence our Hidden Markov model should contain three states. Later we can train another BOOK models with different number of states, compare them (e. g. using BIC that penalizes complexity and prevents from overfitting) and choose the best one. For now let's just focus on 3-state HMM.

*An introduction to hidden markov models for time series*  
Hidden Markov Model: States and Observations. Filtering of Hidden Markov Models. With the joint density function specified it remains to consider the how the model will be utilised. In general state-space modelling there are often three main tasks of interest: Filtering, Smoothing and Prediction.

Hidden Markov models (HMMs) describe the relationship between two stochastic processes, namely, an observed outcome process and an unobservable finite-state transition process. Given their ability to model dynamic heterogeneity, HMMs are extensively used to analyze heterogeneous longitudinal data.

Finally, we exploit hidden Markov models (HMM) to derive the relations existing in the granular time series. A series of experiments using publicly available data are conducted to assess the performance of the proposed prediction method. The comparative analysis demonstrates the performance of the prediction delivered by the proposed model.

2.1. An EM algorithm to infer the discrete-time model. We consider a discrete-time model derived from the continuous-time Markov chain with the probability transition matrix P and initial distribution  $\pi$ . For convenience, let  $\lambda = (P, \pi)$ . We next describe the procedure to infer  $\lambda$  from a sequence of T observations.

Hidden Markov Model (HMM) is a statistical Markov model in which the system being modeled is assumed to be a Markov process - call it - with unobservable ("hidden") states.HMM assumes that there is another process whose behavior "depends" on .The goal is to learn about by observing .HMM stipulates that, for each time instance , the conditional probability distribution of given the history ...

A hidden Markov model is a bivariate discrete time stochastic process  $(X_k, Y_k)_{k \geq 0}$ , where  $(X_k)$  is a stationary Markov chain and, conditional on  $(X_k)$ ,  $(Y_k)$  is a sequence of ...
