Metamorphic rock—Metamorphic facies | Britannica

Metamorphic rocks result from the forces active during plate tectonic processes. The collision of plates, subduction, and the sliding of plates along transform faults create differential stress, friction, shearing, compressive stress, folding, faulting, and increased heat flow.

Geol.Metamorphic Rocks

A metamorphic facies is characterized by a stable mineral assemblage specific to a pressure-temperature range and specific starting material. Subduction zone metamorphism is characterized by a low temperature, high-ultrahigh pressure metamorphic path through the zeolite, prehnite-pumpellyite, blueschist, and eclogite facies stability zones of subducted oceanic crust.

7.3 Plate Tectonics and Metamorphism All of the important processes of metamorphism that we are familiar with can be directly related to geological processes caused by plate tectonics. The relationships between plate tectonics and metamorphism are summarized in Figure 7.14, and in more detail in Figures 7.15, 7.16, 7.17, and 7.19.

Metamorphic Facies—an overview | ScienceDirect Topics

Metamorphic facies. Metamorphic petrologists studying contact metamorphism early in the 20th century introduced the idea of metamorphic facies (part of a rock or group of rocks that differs from the whole formation) to correlate metamorphic events. The concept was first defined in 1914 by a Finnish petrologist, Pentti Eelis Eskola, as any rock of a metamorphic formation that has attained ...

The metamorphic facies series encountered in different tectonic regimes or settings can be summarized as follows, and are shown schematically on Figs. : Ridges and rift valleys: characterized by high geothermal gradients contact and ocean floor metamorphism.

Orogeny—Wikipedia

Based on inspection of extreme metamorphism and post-subduction magmatism at convergent plate margins, paired metamorphic belts are further extended to two contrasting metamorphic facies series: one is blueschist to eclogite facies series that was produced by subducting metamorphism at low thermal gradients of <10 o C/km, and the other is amphibolite to granulite facies series that was ...

M.P. Searle, in Treatise on Geophysics (Second Edition), 2015. 6.11.4.4 Continental Subduction and UHP Metamorphism. The earliest metamorphism recorded along the North Indian Plate margin is an (ultra-)high-pressure eclogite facies metamorphic event seen in the Kaghan region, north Pakistan, and in the Tso Morari complex, NW India.

What is the relationship between metamorphism and plate ...

Metamorphism means change in the rock texture and mineral composition of a rock. Plate tectonics is the scientific theory of large scale plate movements of the earth. Divergent plate margins show greenschist facies metamorphism and the metamorphic rock is metabasalt. Convergent plate margins is a more complex margin including blueschist facies, ophiolite and higher grade of metamorphism ...

Metamorphic grades. The different groups of minerals, or assemblages, that crystallize and are stable at the different pressure and temperature ranges during regional metamorphism distinguish distinct metamorphic grades, or faces. The grades are usually named for the dominant minerals or colors that identify them (Figure 1).

Subduction zone metamorphism—Wikipedia

Accretionary orogens, which were produced by subduction of one oceanic plate beneath one continental plate for arc volcanism. They are dominated by calc-alkaline igneous rocks and high-T/low-P metamorphic facies series at high thermal gradients of >30 °C/km. There is a general lack of ophiolites, migmatites and abyssal sediments.

Metamorphism and Plate Tectonics Flashcards | Quizlet

Plate Tectonics, Metamorphism and Time Certain metamorphic facies are indicative of particular structural, or plate tectonic settings. Microstructural examination of metamorphic rocks often allows you to see relationships between past metamorphic events that allow an interpretation of the tectonic history of the rock.

A foliation found in metamorphic rocks with more than 50% plate and elongated minerals is known as _____, and the rock this foliation is found in is called _____. schistosity, schist Metamorphic rocks are very common in the crystalline basement rocks of the oldest parts of continents.
